

** Setup **

* To install Angular CLI

`> npm install -g @angular/cli`

node.js needed

global install

* To access angular cli \rightarrow *ng*

- * To check angular version

```
> hg --version
```

- * Start a new app ← might be better if you prefer Tailwind

```
> ng new <project-name> --dry-run
```

- ↳ will log activity on terminal but not add any files to project

- * To create an app with some configuration

> ng new first-ng-app -inline-style -inline-template

for adding inline styles
(won't create style.scss file)

**** Navigation * ***

- json and .config files

→ runs a development server

- /src

- /app → main working directory for components

- index.html → For browser to load metadata and main component

→ main.ts → to render app components

↳ style.scss → for global styling

- /public → for any assets → img, svg, font, etc

- /node_modules → node packages

- /angular → angular packages
