

* Some useful docker commands

- > **docker system prune**
Removes unused images, containers or dangling cache. Useful to empty up space.
- > **docker stats CONTAINER**
to see disk, CPU and memory used by a container. Useful to troubleshoot slow performance.
- > **docker inspect CONTAINER**
this will show us advanced information about a container in JSON. For debugging.
- > **docker context ls**
to see which context our docker client is running onto. (*) will tell which one is running.
- > **docker context use <docker-context-name>**
to switch between contexts.
