** Data Binding **

how to bind the data from the ts class to HTML template.

* With signals:

With in the ts class we can create some signals:

```
eg   class   MyComponent {
          myVar = signal ('some value');
     }
```

then inside the HTML template we can use the like:

```
<p> Here's my var's value: {{ myVar() }} </p>
```
↳ acts like a function

* Without signals (traditional way)

In the class component
```
class  MyComponent {
          myVar = 'Some Value'; → Normal property
     }
```

In template file:

```
<p> Here's my var's value: {{ myVar }} </p>
```

Note!

We should use signals as they are widely used and will be developed more by Angular community.
