** Routing **

Next uses a file based routing system.

?? How to do it?

Consider your initial file system

Project   ← initial home route (·/)
├── /app
│   └── page.tsx   ← contains what to show in app route
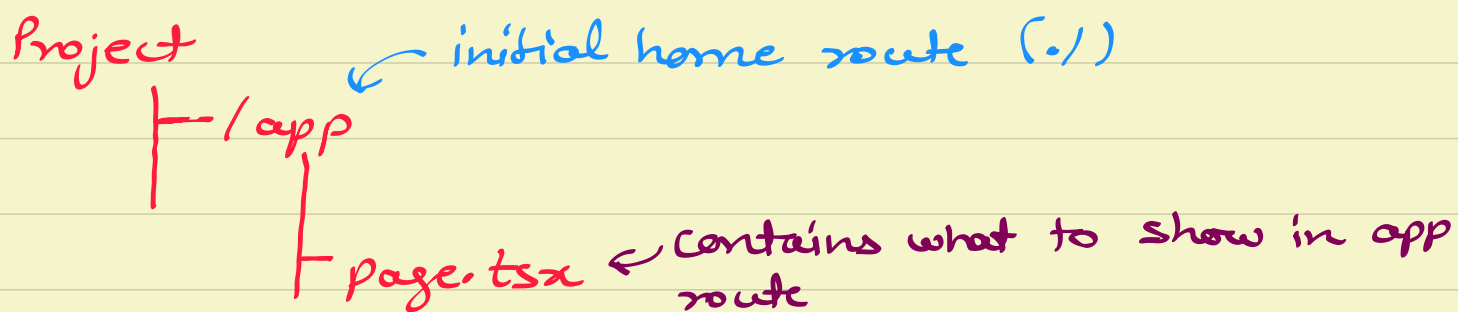

let's add an user route i.e. (·/user)

Project
├── /app
│   ├── page.tsx
│   ├── ...   in Next. adding a new folder in @/app
│   └── /user   ← creates a new route
│   └── page.tsx
│   ← contains what to render for its corresponding route
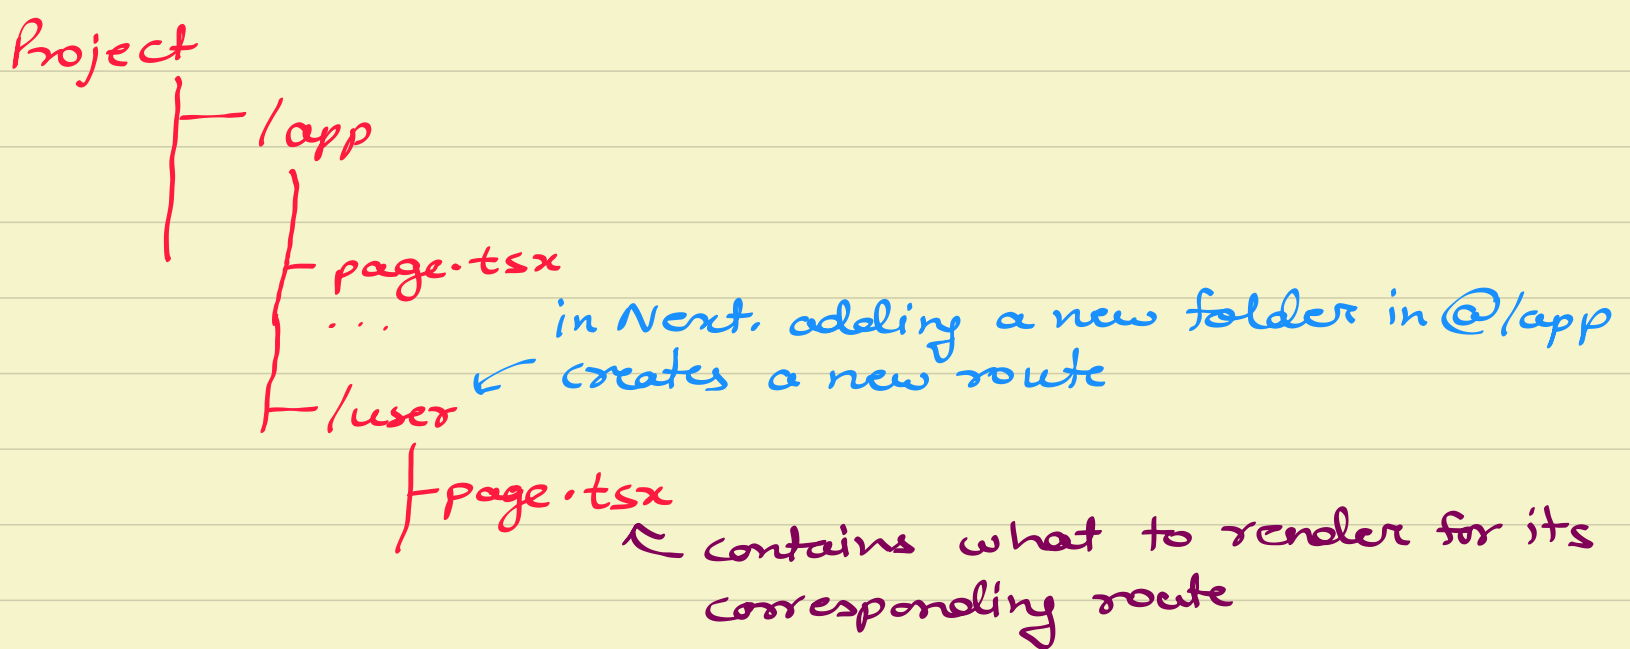

In summary :-

- Each folder inside @/app becomes a route and to access it on browser we can use normal path format, ie. ·/--/--/---
                                        ↳ folder names

- the page.tsx contains the code to render on each route

- Same thing can be done for nested routes i.e. for ·/user/dashboard and ·/user/info

/app
├── /user
│   ├── /dashboard ←
│   └── /info ←
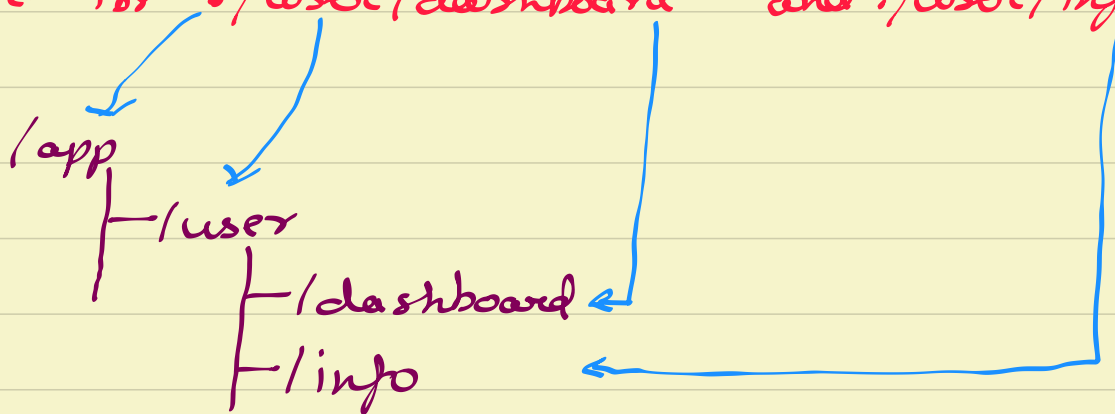

Simple right !!! just remember to add page.tsx for each of them.

?? What about dinamic routes!

More on this in next lesson.
